Purpose

The purpose of this lab is to configure a remote access method that an employee could use in a corporate setting to access the company office's network remotely. To complete this task a virtual private network (VPN) must be set up by configuring a portal, gateway and tunnel that clients can use to gain access to the local area network (LAN) of an office network. Additionally, some machines in the LAN will be arranged to receive remote desktop protocol (RDP) packets, so that employees can access machines with possibly sensitive information that must remain at offices.

Background Information

One important tool that a company should offer to their employees is a way to remotely access the company office's LAN. One way is to configure a VPN by setting up an IPsec tunnel. Looking at the logical workings of a VPN, the employee is often somewhere in a private network outside the office LAN. To allow an employee to access the local network, an IPsec tunnel is established between these two private networks over the internet. This allows packets from one private network to be directly sent to the other private network securely. As a result of this process, employees will be able to access local office network resources, like local servers and workstations.

Now, some may be skeptical and ask why such a tool is needed by employees, but this tool offers many benefits. One such benefit is keeping company information secure, since a VPN securely connects employees to the office network and forces all info to go through the company office network which is protected should be protected by a firewall. Another benefit is allowing employees to access sensitive information that must be kept on-premises for either legal or company policy reasons.

One feature of a VPN is split-tunneling. This can allow traffic from the employee's remote machine to send some network traffic over the internet and some traffic over the tunnel. This configuration can allow sensitive company documents to be sent over the VPN but have network traffic like web searches go directly to the internet. This split tunneling offers the benefit of only having needed network traffic go through the tunnel, which can quicken all other network traffic and is another intricate part of configuring a VPN.

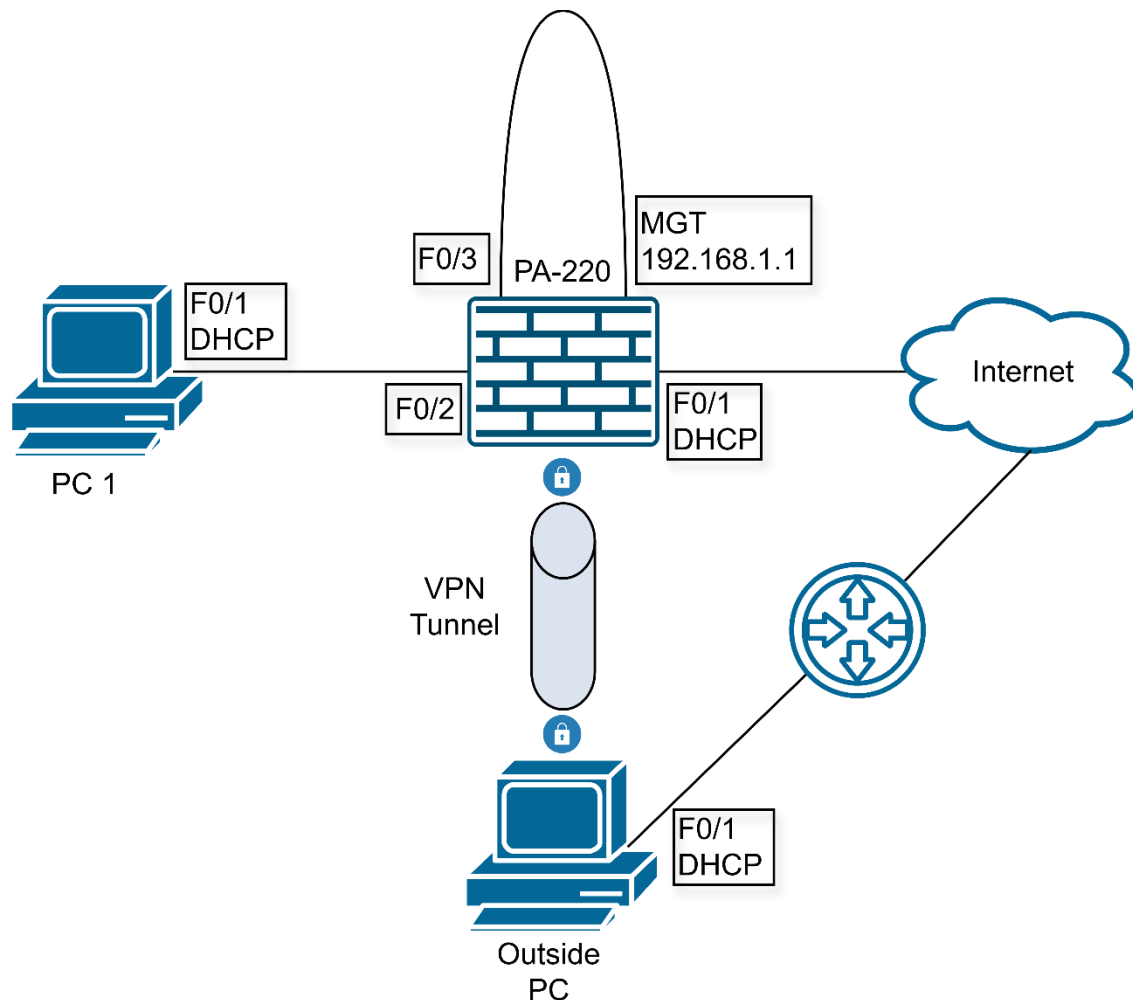

Another part of this lab is the configuration of remote desktop protocol (RDP). Configuring employee workstations to receive RDP packets allows employees to access their local machines to check in on results if they're working remotely or can't come into the office. This can allow IT to easily maintain machines as well and access servers.

Lab Summary

In this lab, a Global Protect portal and gateway were configured to allow access to a LAN from the outside using a VPN connection. Additionally, RDP was configured on a machine inside the LAN, so that VPN clients can remotely access machines on the LAN using remote desktop connection software. In this diagram, PC 1 acts as the machine that a VPN client can initiate an RDP connection with after using GlobalProtect client to get into the LAN. It is important to note that in an actual professional environment, this machine should have a static IP, a fully qualified domain name (FQDN), or have a

domain entry assigned to it by the VPN server published to the client; but this is outside of the scope of this lab.

Network Diagram with IPs

Problems

One problem was run into when attempting to split-tunnel the traffic. We were attempting to split tunnel the traffic, so that only packets addressed to the office LAN would pass through the tunnel and have the rest of the packets just enter the internet. This was a quick problem to solve because we realized that we were using the wrong network number for the subnet of addresses on the LAN. After fixing that issue, the split-tunneling worked.

Conclusion

Configuration of a VPN is important for small companies to set up. Through the steps outlined in this document, any small company can configure their PA-220's VPN gateway and portal, so that employees can access company LANs remotely. Additionally, the document also outlines the procedure of how to arrange Windows 11 machines to be

remotely accessed through RDP along with the VPN, another important tool for employees.

Configs

Config Selection Criteria | Authentication Override | **IP Pools** | Split Tunnel | Network Services

☐ Retrieve Framed-IP-Address attribute from authentication server

☐ AUTHENTICATION SERVER IP POOL ^

Enter IP subnets or ranges to match the Framed IP attribute of the authentication server. Supports IPv4 private/public addresses (e.g. 192.168.74.0/24, 192.168.75.1-192.168.75.100) or IPv6 unique local/public addresses (e.g. 2001:aa::1-2001:aa::10)

+ Add - Delete

These IPs will be added to the firewall's routing table

☐ IP POOL

☒ VPN_Addresses

+ Add - Delete

Configs

Config Selection Criteria | Authentication Override | IP Pools | **Split Tunnel** | Network Services

Access Route | Domain and Application

☐ No direct access to local network
No direct access to local network is applicable to Windows, Mac and Linux only

☐ INCLUDE ^

☒ Local_Addresses

+ Add - Delete

These routes will be added to the client's routing table. More-specific routes take precedence over less-specific routes.

☐ EXCLUDE ^

Enter subnets that clients should exclude (e.g. 172.16.1.0/24)

+ Add - Delete
